

Day 5

Today was a hands-on session focused on applying everything we learned this week. We designed and developed a simple, single-page landing page using HTML and CSS. This project allowed us to practice real-world web development fundamentals, including layout design, content structuring, styling, and minor interaction elements like hover effects.

Project Title:

"Landing Page"

Skills & Concepts Used:

1. HTML:

- Semantic elements
- Structural tags
- Lists and links

2. CSS:

- External CSS stylesheet
- Box model (margin, padding, border)
- Color schemes and fonts
- Layout with containers
- Hover effects on links and buttons

Summary:

This project was a perfect end to the first week. I was able to connect all the dots—from writing clean HTML structure to styling and laying out the content using CSS. The project helped reinforce the box model, selector usage, semantic HTML, and responsive layout principles. It also made me more confident in using VSCode and Live Server to build and preview a web page.

- Structuring a real web page with reusable code
- Designing for clarity and simplicity
